

A 79 year old woman with a history of CAD, hypertension, hyperlipidemia, and diabetes mellitus type II comes into the ED complaining of vision loss that occurred two hours ago. She was watching TV when she noticed difficulty seeing out of her left eye. She denies headache, nausea, vomiting, seeing floaters, or any recent trauma. Her eye is non-red and her vision is slowly improving. She does have some mild facial drooping on smiling. What is the likely diagnosis?

- a) Intracranial neoplasm
- b) TIA
- c) Acute angle closure glaucoma
- d) Migraine with aura
- e) Retinal detachment
